

Figure 9 Sandy coastal system

Main decisions

To develop adaptation agenda for sand for sandy coastal system based on the principles of 'prevention as top priority, maintain territory and coastal foundation zone in balance with relative rise in sea levels'

- **Current sandy coastal system: this will include sediment transport**
increase in sand replenishment required in relation to the relative rise in sea levels, the sand demand of the open basins with erosion of the outer deltas and channel margin replenishment
- **Dunes as an integral part of the sandy coastal system**
ensure adaptation to relative rise in sea levels through management, maintenance and increase in sand replenishment
- **Former inlet closed off using hard elements, putting an end to sediment transport**
issue of open basins adapting to sea level rise by increasing sand replenishments
- **Non-sand-sharing part of the original sandy coastal system***
- **Reclaimed parts of the original sandy coastal system***
